

2013 Lamprey Rivers Management Plan

Updated and Expanded from 2007 Edition

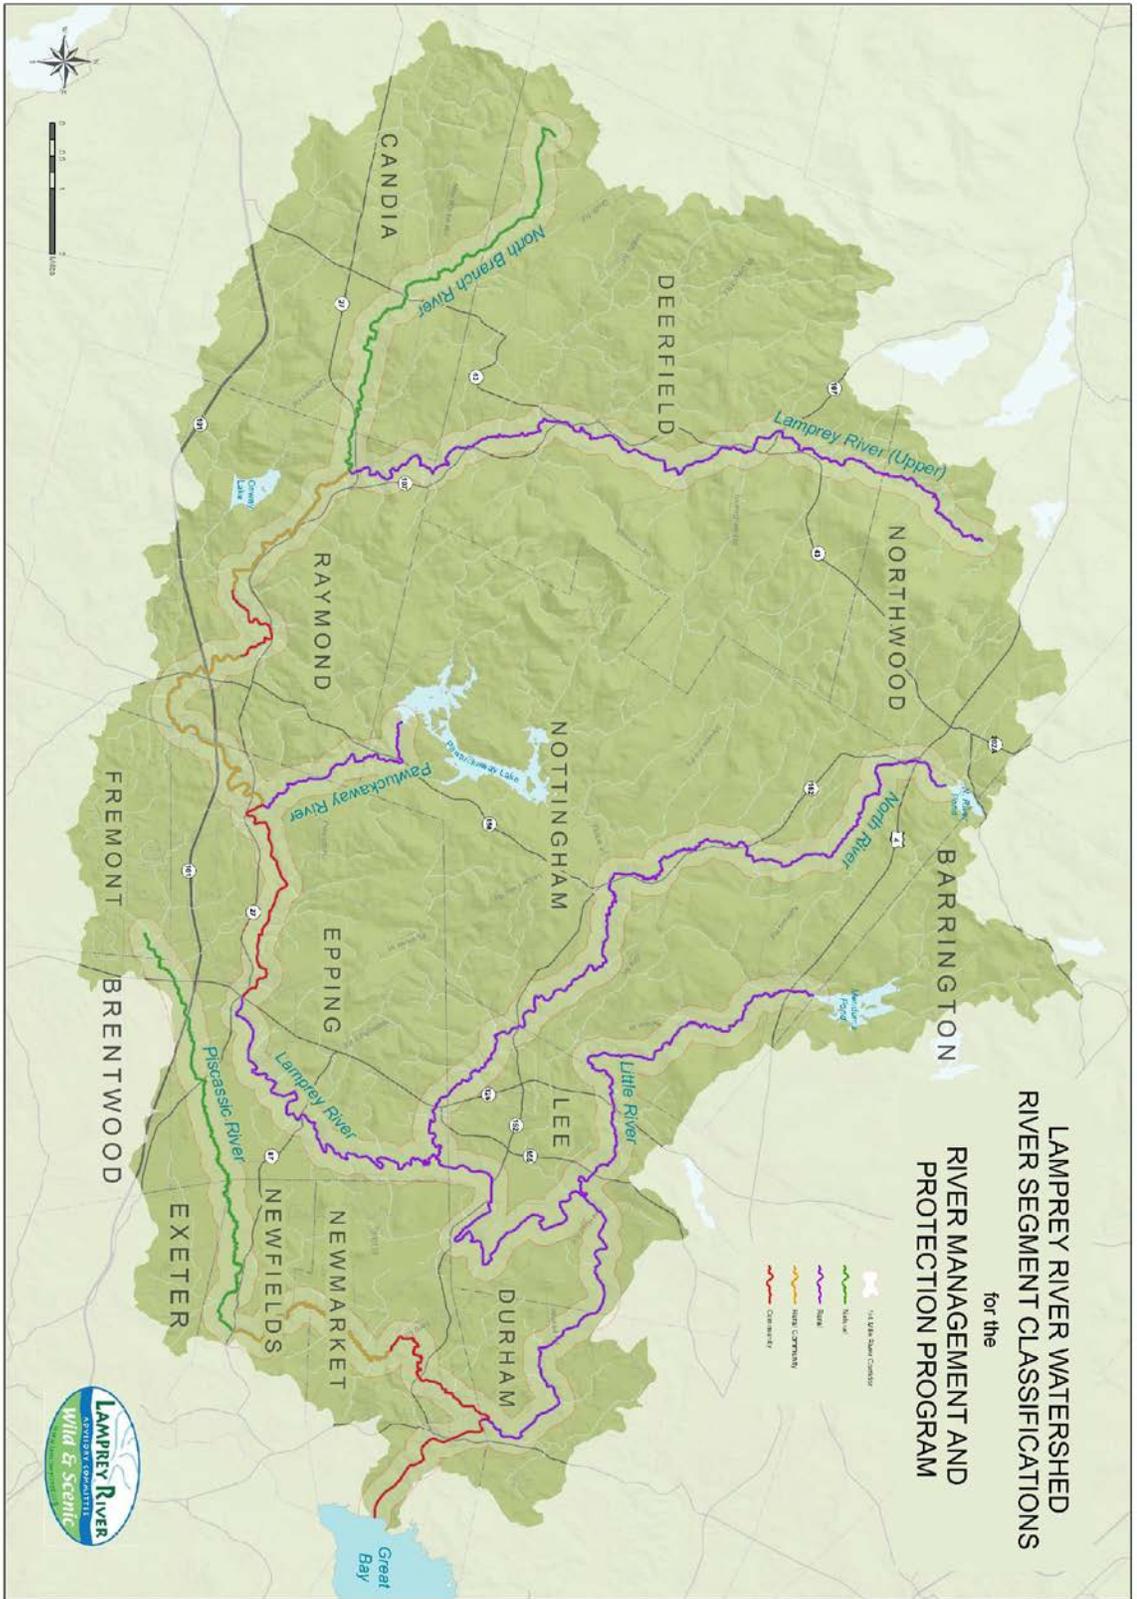

DRAFT

Deerfield Bridge over the Lamprey River, photo by Dawn Genes

Prepared by

the Lamprey Rivers Advisory Committee

Statement of Management Philosophy

The Lamprey River and its major tributaries (North Branch, Pawtuckaway, North, Little, and Piscassic rivers) have been recognized as significant ecological, historic, recreational, and water supply resources by the New Hampshire Rivers Management and Protection Program. In addition, the lower 23 miles of the main stem Lamprey River have been designated under the federal Wild and Scenic Rivers Program. Both programs require an advisory management plan to aid in protecting and managing the resources of the rivers. The Lamprey Rivers Management Plan must provide balance among its three main goals:

1. Protect the ecosystem and associated ecological services of the rivers and their quarter-mile corridors.
2. Promote responsible community use of the rivers and the surrounding land.
3. Respect the interests and rights of property owners while enlisting their support as guardians of the rivers' assets.

The population of the Greater Seacoast area is increasing. The rivers and the land surrounding them face increasing pressure from development and recreational use. As the natural landscape changes, maintaining and improving the current condition of the rivers will be more difficult.

It must also be noted that the Lamprey River and its tributaries contribute a significant amount of water to Great Bay. The Great Bay Estuary and portions of the Lamprey River are showing signs of decline and do not meet federal Clean Water Act criteria for several indicators. Special attention must be paid to mitigating the increase in nitrogen, sediment, and other pollutants that reach the waterways and incorporating climate change science to predict the adverse effects and proper response to severe storm events. The condition of the rivers and Great Bay reflects the actions of individuals and communities that populate the land surrounding these bodies of water.

The importance of educating the public and working together to attain the management plan goals is critical to our shared future. Central to this work will be encouraging the public and various partners to view the rivers as important and worthy of the collective efforts that will be needed for protection now and into the future. The future of the rivers and Great Bay as community assets rests squarely on the willingness of individuals and towns along the river to be knowledgeable and careful stewards. We must all learn to “tread lightly” in the watershed if we are to meet this challenge successfully.

Programs & Abbreviations

GIS – Geographic Information System, a computer support system for mapping and mapping-related data.

LRAC – Lamprey Rivers Advisory Committee

LRWA – Lamprey River Watershed Association

NERR – National Estuarine Research Reserve

NHDES – New Hampshire Department of Environmental Services

NPS – National Park Service

NRCS – Natural Resource Conservation Service

PREP – Piscataqua Region Estuaries Partnership

RMPP – NH Rivers Management and Protection Program

UNH – University of New Hampshire

USGS – US Geologic Survey

VRAP – NH Volunteer River Assessment Program

Wild and Scenic River – National system of outstanding rivers into which individual rivers are designated by US Congressional action.

401 Water Quality Permit – Permit allowing the discharge of water into a waterbody, under Section 401 of the federal Clean Water Act.

Executive Summary

In 1990, the main stem Lamprey River in Durham and Lee was designated into the NH Rivers Management and Protection Program. A few years later, this section was designated as a federal Wild and Scenic River and the section was expanded to include much of the main stem Lamprey in Newmarket and Epping. In 2011, the entire Lamprey River and five of its major tributaries (North Branch, Pawtuckaway, North, Little, and Piscassic rivers) were designated into the NH Rivers Management and Protection Program.

The state has formally recognized that water does not respect town boundaries. What happens in one town, in one neighborhood, on one parcel, affects others around it. The 2011 designation marked the first time an entire watershed system was effectively protected as a single unit. The fourteen towns with a connection to the Lamprey were unanimous in seeking this designation. The Lamprey Rivers Advisory Committee (LRAC or the Committee) is the state appointed local advisory body and now includes representatives from Barrington, Brentwood, Candia, Deerfield, Durham, Epping, Exeter, Fremont, Lee, Newfields, Newmarket, Nottingham, Northwood, and Raymond.

The Lamprey and its tributaries have outstanding ecological, historical, and recreational value. The main stem Lamprey is also a public water supply. One of the main duties of the Committee is to craft an advisory management plan to protect these qualities that earned inclusion of the rivers in the state rivers program. This plan is intended to guide the Committee's own work, recommend actions for municipalities, highlight opportunities to work with other groups concerned with river issues, and provide information for concerned citizens. Cooperation among concerned parties will result in better outcomes toward watershed-related goals better than any one entity alone can realize.

This management plan builds on the work from the original management plan from 1995 and the revision from 2007. In addition to issues identified in previous management plans, this revision seeks to address several major issues that have arisen in the watershed in the past several years, including the following:

- many new residences built or planned in Lamprey River towns
- a significant increase in the amount of paved and other impervious surfaces (Since 1990, the amount of impervious surfaces in the Great Bay watershed has increased by 120% and the population has grown by 19%, PREP, 2013 State of the Estuaries Report)
- the paradox of severe floods that caused significant damage and droughts that challenged public water suppliers and river habitats
- state listing of sections of Great Bay and the Lamprey River as "not meeting" water standards for fishing, recreation, and aquatic life.

The Committee will also continue to address issues identified in the past:

- loss of wildlife habitat, water impairments, and negative impacts on the natural and scenic qualities of the rivers that result from development of river corridors and beyond
- getting buy-in from landowners to engage in good land stewardship practices that protect the rivers and associated habitats
- keeping the public informed and engaged about the rivers through educational programs and materials and recreational access
- promoting the ecological health of the rivers through support of wildlife research, and municipal or state policies that result in enough clean water for aquatic and riparian life

Background

The Lamprey Rivers Advisory Committee

The Lamprey Rivers Advisory Committee (LRAC, the Committee) is mandated by both the New Hampshire Rivers Management and Protection Program and the federal Wild and Scenic Rivers Program to participate in the management of the Lamprey River and five of its main tributaries: North Branch, Pawtuckaway, North, Little, and Piscassic rivers. Each of the fourteen towns in the Lamprey River drainage area has at least one Committee member. Members are nominated by the governments of their towns and then are appointed by the commissioner of the New Hampshire Department of Environmental Services for a three year term. Members, serving as volunteers, represent the interests of local government, business, agriculture, conservation interests, recreation, and river landowners. The Lamprey Rivers Advisory Committee is distinct from the Lamprey River Watershed Association (LRWA), a nonprofit membership group operating throughout the area. The two organizations often collaborate in efforts to enhance protection of the Lamprey.

Designations

The Lamprey River and five of its main tributaries (North Branch, Pawtuckaway, North, Little, and Piscassic rivers) have been designated for special protection by the State of New Hampshire through the NH Rivers Management and Protection Program. In addition, the section of the main stem Lamprey River from the former Bunker Pond Dam in West Epping to the confluence with the Piscassic River in Newmarket has been designated for protection by the US Congress under the Wild and Scenic Rivers Act.

These designations and subsequent protection resulted from the efforts of local citizens who documented the Lamprey's outstanding natural and cultural resources and encouraged the unanimous support of the fourteen towns. In addition to the recognition already achieved at the state level, there is also interest in extending Wild and Scenic designation to upstream towns. With sufficient public support and the assistance of LRWA and LRAC, these initiatives might move forward.

1. New Hampshire Rivers Management and Protection Program

The New Hampshire Rivers Management and Protection Program (RMPP) was enacted in 1988 to protect the state's most significant rivers or river segments. In 1990, the section of the Lamprey River that runs through Lee and Durham was among the first rivers nominated into the RMPP. In 2011, the entire Lamprey and five of its major tributaries were designated. The RMPP provides for the establishment of a local advisory committee on each designated river or segment to implement river management and protection policies at the local level.

The Lamprey Rivers Advisory Committee serves as the local advisory committee for the Lamprey and the tributaries. The Committee is legislatively responsible for four main duties per RSA 483:

- Advise the NH Dept. of Environmental Services (NHDES) commissioner, the NH Rivers Management Advisory Committee, the municipalities through which the designated river or segment flows, and the municipalities within tributary drainage areas on matters pertaining to the management of the river or segment and tributary drainage areas.
- Consider and comment on any federal, state, or local governmental plans to approve, license, fund, or construct facilities that would alter the resources and characteristics for which the river or segment is designated.
- ***Develop or assist in the development and adoption of local river corridor management plans. Local planning boards may adopt such plans as an adjunct to their local master plan.***
- Report biennially to the NH Rivers Management Advisory Committee and the commissioner, and annually to municipalities on the status of compliance with federal and state laws and regulations, local ordinances, and plans relevant to the designated river or segment, its corridor, and tributary drainage areas. NHDES offers the committee technical assistance in developing and implementing the management plan.

The state assumes responsibility for assisting the local advisory committee and provides the following protections for the Lamprey:

- a prohibition against the construction of new dams, the use of flashboards on existing dams, and interbasin transfer of water from the Lamprey River
- protection of water quality and maintenance of adequate year-round flows in the river to support a full range of natural resource needs and also human uses
- mandatory setbacks for new solid and hazardous waste facilities

Otherwise, the state program does not regulate local zoning or confer special regulatory powers to state agencies relative to protected rivers.

2. Designation under the federal Wild and Scenic Rivers Act

The broad purposes of national designation of a river as a Wild and Scenic River are to:

- Establish federal policies for the watercourse which ensure that federal actions are consistent with protecting the resources for which the river was designated.
- Provide for financial and technical assistance from the National Park Service in implementing the River Management Plan.

Most of the 160 rivers in the National Wild and Scenic Rivers System flow through federally-owned land and are managed by the federal agency that manages the land. In contrast, many of the designated rivers in the East flow through private lands. These rivers, including the Lamprey, are called *Partnership Wild and Scenic Rivers*, because their management occurs through a partnership of the National Park Service and a local river management advisory committee. According to Jamie Fosburgh (leader for the Northeast Region Rivers Program of the National Park Service), Partnership Wild and Scenic Rivers share the following characteristics:

- No lands are federally owned.
- Administration is accomplished through a broadly participatory committee.
- Management and use of lands adjacent to the river continue to be the responsibility of landowners subject only to existing state and local regulations.
- The River Management Plan is written and implemented through a broadly participatory process.
- The National Park Service reviews federally funded, sponsored, or licensed projects to ensure federal consistency with the plan's river protection goals.
- The costs and responsibilities for managing and protecting the river's resources are shared among all of the partners—local, state, federal, and non-governmental.

Twenty-three and a half miles of the Lamprey River are designated as a Wild and Scenic River, from the former Bunker Pond Dam in Epping to the confluence with the Piscassic River in Newmarket. The area of jurisdictional oversight is approximately one quarter mile on each side of the river.

The 1995 Lamprey River Management Plan was developed as a part of the National Wild and Scenic River Study of the Lamprey. The plan included specific provisions related to Wild and Scenic designation, all of which were carried forward in the 2007 Update and this 2013 Plan. These provisions, together with the National Park Service's June 1995 Draft Report to Congress, and the text of federal legislation in 1999 and 2001 designating the portions of the Lamprey into the federal system, provide the full background and context for the National Wild and Scenic River designation of the Lamprey.

Focus Areas and Working Groups of the Lamprey Rivers Advisory Committee

The following synopses highlight the seven key focus areas of the management plan revision that are explained later in more detail:

Enough Clean Water (Refer to page 15 for more detail.)

The worth of a river to people and wildlife is largely defined by the amount of water that flows in the river and how clean the water is. Diligent monitoring and safeguarding of the water in the rivers will always be a priority. The Committee will continue its role as a watchdog, tracking the results of water tests being conducted by various groups and reviewing and commenting on development proposals to avoid or minimize degradation of the river. Although much of the water in the rivers is clean at present, meeting the needs of wildlife, habitats, and people while addressing the growing human population and increasingly developed landscape will be challenging in the near future.

The main stem Lamprey is one of two rivers chosen by NH Dept. of Environmental Services for a pilot instream flow management plan. The amount of water in the river has been studied extensively and compared to minimal needs of fish. A state-issued management plan whose goal is to assure at least minimal flows for wildlife needs will be released in the near future. Protecting clean water is more than protecting against pollution; it also involves ensuring an adequate flow. If fish can be assured of enough clean water, other creatures, including humans, will also have enough water to meet their needs.

History and Archaeology (Refer to page 21 for more detail.)

The Committee believes that a community's sense of place depends in part upon knowledge of its history. The Committee has worked hard to help residents connect with their rivers through videos, historical activities, and informational kiosks. The Committee will continue to conduct research and document the history of the rivers, including funding professional work and collecting and preserving important documents.

Land Protection and Conservation (Refer to page 24 for more detail.)

LRAC has partnered with towns, land trusts, and other organizations to permanently conserve about 2700 acres of land and more than 13 miles of river frontage using Wild and Scenic partnership funding. Land protection will continue to be a key focus of the Committee's work, especially in the Wild and Scenic River towns of Epping, Lee, Durham, and Newmarket. Because of ecological

research done in the past decade and the NH Wildlife Action Plan, LRAC now has an even better understanding of which lands are most critical for protecting wildlife on the Lamprey. In the next five years, LRAC will undertake new work with town conservation commissions and other organizations to support land conservation efforts, extending information to residents and riverfront landowners on why and how to protect the Lamprey River corridor for the future.

Outreach and Public Education (Refer to page 28 for more detail.)

The Committee strives to be “the local voice for the river” and to help others to become its advocates as well. In the past, this has included working with local schools, developing curricula, creating informational brochures and DVDs, posting signs at river crossings, conducting workshops, hosting educational events, and bringing displays to various public venues. The Committee’s recently revamped website, www.lampreyriver.org, serves as a hub of Lamprey River resources. In the coming years, LRAC’s important outreach work that promotes enjoyment and protection of the Lamprey rivers will continue.

Project Review (Refer to page 31 for more detail.)

The Committee is charged with reviewing all projects requiring a state or federal permit that could impact the Lamprey or its tributaries. With input from members from each of the fourteen towns, the Committee also closely follows river-related local issues such as proposed developments or changes in regulations. In many instances, comments from the Committee will lead to cooperative efforts among the town, the developer, and state and federal regulatory agencies that result in improvements to projects, making them more protective of the rivers and their corridors.

Recreation and Public Enjoyment (Refer to page 36 for more detail.)

To help connect residents to their rivers, LRAC has helped to develop public access and parks at several sites along the Lamprey. The Committee plans to expand these efforts to include the tributaries. Increased recreation has many challenges that must be considered: some sections of the rivers are inaccessible, some are on private land, and others are overused. The Committee plans to proceed cautiously so recreational use will reflect its “Tread Lightly” philosophy toward providing for public enjoyment that does not degrade the rivers.

Wildlife and Ecology (Refer to page 39 for more detail.)

The Lamprey River and its tributaries have maintained most of the healthy, diverse habitat types that made them eligible for protection under both the state and federal river programs. In the next decade, LRAC will continue to work to maintain these unspoiled natural areas through research, land conservation, careful review of development proposals, measures to control invasive species, restoration of fish passage, and assuring adequate water levels in the river. The Committee will encourage Lamprey towns to establish standards that protect clean water and habitats of the rivers. Efforts to inform landowners how to maintain the ecological value of the rivers to a wide variety of plants and animals will continue.

The following seven sections comprise the details of the plan outlined above, including accomplishments, goals, and key future actions. The plan is deliberately ambitious, representing a full menu of initiatives seen as desirable, rather than a commitment to accomplishing all in the next decade. In many instances, successful collaboration will be essential to the accomplishment of the plan's identified actions and goals. The Committee often will play a supporting role to others who possess the necessary expertise, staff, authority, or resources to get a particular job done.

Enough Clean Water

testing the water photo by Breakaway Media

Background

Clean, abundant water in the Lamprey River and its tributaries (North Branch, Pawtuckaway, North, Little, and Piscassic) is central to the Lamprey Rivers Advisory Committee's mission for the river corridors. In diverse ways, many of LRAC's efforts are intended to maintain and/or improve water in the rivers. Since 1998, the Lamprey River Watershed Association has conducted summer water quality monitoring along the length of the Lamprey often with financial support from LRAC. The data collected are then processed by the New Hampshire State Volunteer River Assessment Program (VRAP). Focused chemical analyses have been done by the University of New Hampshire (UNH) and the NH Dept. of Environmental Services (NHDES). To manage adequate flows in the main-stem Lamprey River, NHDES has created a pilot In-stream Flow Management Plan for the Lamprey River. The Committee continues to have a role in on-going planning and refinements of this plan.

The Lamprey is legislatively classified as a Class B "fishable and swimmable" river and is thus managed by NHDES under the federal Clean Water Act to maintain these conditions. Most of the tributaries are similarly classified, while the Piscassic River meets a higher standard and is a Class A river. A significant amount of land protection, state and local municipal zoning ordinances that protect shorelands, and good land management by property owners all help to maintain clean water. The upgrade at the waste water treatment facility in Epping also has contributed to improving the Lamprey's water. Since the Lamprey River

is a source of municipal drinking water, clean water is critical to all who live in its vicinity.

Maintaining clean, abundant water requires vigilance: widespread and frequent monitoring; review of potentially problematic development on shore; education of landowners (both public and private); and a readiness to work with local, state and federal regulators to prevent and address problems as they arise. Despite many strong efforts, the water in the rivers faces several threats, including the following:

1. Development in the river corridor has resulted in a significant increase in paved and other impervious surfaces. When rain water moves *across* surfaces rather than soaking *in*, several problems arise:

- Stormwater moving across unvegetated surfaces erodes soil and can cause siltation in the river. Both land and water are negatively impacted.
- Stormwater runoff carries lawn fertilizers, animal waste, and roadway pollutants such as salt and automotive fluids to waterways. These chemicals alter the natural condition of water and can cause significant harm to animals and humans who rely on clean water.
- Stormwater runoff from roads, parking lots, and rooftops in summer can substantially increase water temperature, lowering the ability of certain fish species to survive in the rivers.
- Pavement and other altered surfaces prevent water from soaking into the ground properly. Much of the flow in rivers results from slow additions of water contributed by groundwater. When less water soaks into the ground, less water is available as ground water. Instead of getting a long-term, more moderate flow, the river experiences times of extreme flows during storms and extreme drought when rain is sparse.

Traditional development has focused on channeling and efficiently removing water from a site. Modern, low-impact development recognizes that many or most of the problems cited above can be lessened when water is allowed and encouraged to soak into naturally vegetated soils on site. With this in mind, enhancing good stormwater management practices will continue to be a priority with LRAC's efforts.

2. Streamside “buffers” are being lost. Buffers are areas of natural vegetation that act as areas of transition between land and water. The Lamprey and its tributaries are beautiful rivers and more people are building along them. Unfortunately, people sometimes build too close to the river or a wetland or clear a wide area to enhance their view. Removing or altering this natural buffer area has negative consequences for the landowner and the water:

- Lack of natural vegetation along the river and wetlands means soils are not stabilized or protected from the impact of rain or floods. Erosion of land and siltation of water result.
- Nutrients, in the form of soil, fertilizer, or animal waste, can be carried readily into the water, rather than being absorbed by plants. These excess nutrients cause a cascade of problems that include unsightly and odorous algae growth, murky water, and decreased dissolved oxygen.
- Natural shoreland vegetation shades the water, maintaining cooler temperatures critical to aquatic life. Natural shoreland vegetation also provides important habitat to animals that live in or near the water.

Natural buffers need to be protected by state and local regulation and by land management practices by informed landowners. LRAC seeks to work with governments to enhance protective shoreland buffer regulations and educate landowners about protecting both their land and the rivers.

3. An increasing population increases the demand for water. Many seacoast towns are facing a shortage of safe, reliable drinking water for their residential, commercial, industrial, and community needs:

- Groundwater extraction is increasing, resulting in less water reaching the rivers. As the largest freshwater river in the New Hampshire Seacoast, the Lamprey is viewed by some area towns as a possible source to augment their existing water supplies.
- Low flows in the river, especially during extreme drought, result in concentrated nutrients and warmer water, sometimes causing excessive algae growth. On occasion, this has caused dissolved oxygen levels in the main-stem Lamprey to drop below standards for a “fishable and swimmable” river. Also exacerbated by low flows are the concentrations of copper and zinc which have, on occasion and in certain locations, reached levels considered toxic to wildlife of the rivers.

Members of LRAC are engaged in work to study ways to understand and protect the Lamprey’s in-stream flows.

4. Septic systems are part of the problem and part of the solution. Most landowners along the Lamprey and its tributaries have private septic systems to treat household waste water, yet many do not even know they have a septic system or how it works. Failed septic systems can result in both excess nutrients and pathogens potentially reaching the river. While septic systems cannot remove all nutrients, septic systems that are well planned, placed, and maintained can play a role in keeping river water clean.

Accomplishments

- Created brochures for landowners explaining why and how to manage riverfront lands to ensure clean water and protect wildlife habitat.
- Held a series of workshops on maintaining vegetated buffers to protect the river in partnership with the Oyster River Watershed Association, Strafford Regional Planning Commission, and Strafford County Conservation District.
- Reviewed and commented on proposed state and private development projects to assure that water would not be degraded during and after construction.
- Testified at hearings regarding changes to the state's shoreland/buffer protection statute.
- Held workshops that educated citizens about the connections between ecological and economic integrity.
- Sponsored a pilot outreach program for riverside landowners to understand and improve their septic systems.
- Participated in the state's in-stream flow study by gathering data, identifying important river resources to protect, and reviewing draft documents. LRAC members served on the Technical Review Committee and the Watershed Management Planning Advisory Committee for the study.
- Co-sponsored "Your Water, Your Wallet, Your Watershed" workshop to encourage towns to work across town lines in addressing water issues.
- Assessed and delineated floodplains along the main-stem Lamprey River.
- Co-sponsored a road salt reduction workshop entitled "The Road Less Salted" for public and private snow plowers.

Goals

- Ensure that the Lamprey rivers meet or exceed standards for "fishable and swimmable" water for the health and enjoyment of all species.
- Maintain a viable quantity of water in the main-stem Lamprey River during all seasons sufficient to support and sustain aquatic habitats and wildlife, while considering the need for agricultural and municipal use.

Key Future Actions

- Study and track chemical and physical traits of river water in a consistent manner so that towns and other partners can protect the best water and improve degraded water.
 - Identify what data are available for each river, each town, Pawtuckaway Lake, and Mendum's Pond.
 - Identify what critical data are missing and recommend steps to address the gaps.

- Compare data to state benchmarks and identify which issues could be improved locally.
 - Continue to support volunteer water testing efforts.
- Work with towns to protect and improve the “fishable and swimmable” water of the rivers.
 - Identify at least one problem area per town that does not or would not appear on GIS maps and standard evaluations (such as broken pipes or undocumented erosion areas). Share these problems with town officials or agencies that might be able to provide help in correcting the problem.
 - Work with towns to enact consistent and effective regulations for stormwater, zoning, buffers, and floodplains by 2022.
 - Recommend that all town public works departments enroll in classes to reduce the amount of salt that they apply to town roads. Programs include NH SnoPros, UNH T-Square, and Road Scholars. Encourage towns to adopt salt application standards for private plowers as part of commercial and subdivision planning.
 - Encourage towns to enact septic system inspection and pumping regulations.
 - Create an inventory of impaired stream crossings and prioritize efforts to address the most significant or fixable problems.
 - In fulfilling LRAC’s permit review responsibility, help towns to assess development proposals relative to their effects on clean, abundant water.
 - Plan river-based activities in each town to build awareness that all areas can have “fishable and swimmable” water.
 - Identify emerging issues that affect the water in the rivers and help towns to plan accordingly.
- Work with town residents to protect and improve the water:
 - Expand efforts to educate landowners about septic system care and maintenance.
 - Encourage wide, naturally vegetated buffers and floodplains to minimize erosion and filter run-off.
 - Encourage residents to minimize or discontinue the use of pesticides and fertilizers.
 - Formally recognize landowner efforts that protect clean water.
- Promote water conservation:
 - Support town efforts to develop long-range water use plans and encourage exploration of alternate sources.
 - Encourage all towns to create a water conservation plan and/or consumptive use plan, including mandatory conservation measures during drought.
 - Continue to work with NHDES on the Lamprey River In-stream Flow Management Plan.

- Encourage strategies and regulations for low-impact development or retro-fits so that water soaks *into* the soil and does not flow *across* it.
- Engage towns and residents to identify and correct sources of water loss (broken pipes, leaky faucets, etc.). Sponsor contests that identify and quantify water loss. Develop incentives to conserve water.

History and Archaeology

documenting Wiswall Mill foundation in Durham
prior to construction of fish ladder
photo courtesy of NRCS

Background

People have long recognized the valuable resources that the Lamprey and its tributaries provide. Early native peoples left evidence of a campsite in Lee that University of New Hampshire archaeologists can date back at least 8,000 years. European settlers were drawn to the rivers as an energy source and they built mills there as early as the 1660s. Over the years, more than 100 mills processed timber, grain, cloth, paper, wallpaper, leather, shoes, and iron agricultural tools to supply local and regional needs. The largest mill on the Lamprey was the Newmarket Manufacturing Company founded in 1822. At one time, this mill housed the largest weaving room in the world. River valleys supplied brickyards with extensive deposits of glacio-marine clays that were left following the last Ice Age 11,000 years ago. Epping still sits atop a vast deposit of such clay.

The historic resources of the Lamprey were recognized by both the State of New Hampshire and the US Congress as reasons for designating the Lamprey for protection. The National Park Service's 1995 Draft Report to Congress cited the "outstandingly remarkable" archaeological resources of the Lamprey, thus warranting protection through the Wild and Scenic River designation. The Lamprey River Resource Assessment (1994) lists more than thirty historical sites, including two (Wiswall Dam area and the mill district of Newmarket) that are on the National Register of Historic Places. Other sites include hotels, camps, bridges, railroads, churches, and homesteads as indicated on maps as well as in several historical publications.

Understanding the cultural history of the rivers is important to landowners and the public in developing an appreciation of the rivers. Exposure to river-related

history can enhance a “sense of place” among local residents. Although many river resources have not changed significantly over time, the focus of *human use* has diversified over the years. Recognition of the historic uses is needed if people are to be expected to assist in protecting the rivers, especially as newcomers settle in the communities along the river.

Accomplishments

- River Story: The History of the Lamprey River Through Time VHS has been upgraded to DVD and distributed.
- The Lamprey River Curriculum for both elementary and middle/high school students was updated and is now widely available through LRAC’s website, www.lampreyriver.org.
- Wiswall’s Mill: A Short History DVD documents the history at Wiswall Falls in Durham.
- The Lamprey River Tour: Mary Blair Park DVD documents both the history and present at Epping’s Mary Blair Park.
- More than 100 dams and mill sites in the Lamprey River watershed area were documented and mapped as part of a Small Grant.
- Three of four historic panels at Wiswall Falls have been completed and installed.
- Plans for a historic trail at Mary Blair Park/Folsom Mills in Epping have been completed as part of a Small Grant.
- The Lamprey River Tour Map and Guide offers suggestions for visitors to see highlights of history in the lower four towns.

Goal

Help local citizens understand the historic importance of the rivers in this region and encourage a deeper appreciation of their own sense of place in the on-going history of the rivers.

Key Future Actions

- Assist towns to implement planned historic activities at river parks:
 - Work with Durham to create a fourth panel for the Wiswall Falls Park kiosk that highlights the contributions of John Hatch: artist, professor, and Lamprey River advocate.
 - Work with Epping to make the historic interpretive trail a reality at Mary Blair Park.
 - Work with the Northwood Historical Society to map trails at the headwaters of the rivers.
- Partner with historical committees to help local citizens understand and appreciate the importance of the rivers in human history of the region.
 - Encourage schools to use the Lamprey River Curriculum as appropriate when studying local and state history.

- Add pictures and stories about at least one historical feature per town to the LRAC website.
- Arrange visits to these sites for local people.
- Identify and protect historic and archaeological resources on a site-specific basis, using methods such as signage, barriers, or easements.
- Work with the recreation sub-committee to include historic features on the middle/upper river map and guide.
- Expand the data base of existing dams to include past and potential future uses, such as fish passage and possibilities for tourism and recreation.
- Engage local residents in discovering local history:
 - Create a “History Detectives” program with a local high school and record the show for You Tube, town television stations, etc..
 - Create a place on the LRAC website where people can report historic findings, ask questions, post stories, etc.. Include a list of local historic societies and contact information.
 - Invite local people to record comments and stories about the history of their river communities when they attend events or visit the LRAC information booth.
 - Sponsor programs that promote a “sense of place” among residents.
 - Help towns to identify and provide permanent protection of irreplaceable historical documents that pertain to the river; originals kept locally and copies sent to the NH State Library.
- Seek funding for professional research on the archaeology and history of the rivers. Report findings on the website and in appropriate media, presentations, etc..
 - Study and document archaeological sites along the rivers in addition to those in the Wadleigh Falls area.
 - Research and map the route of the Oxway Road that once connected the McCallen Dam in Newmarket to Wadleigh Falls in Lee; develop information about the building of the road, maintenance, etc..
 - Document the brick industry in Epping. Use it as an example of the connection between human history and utilization of natural resources such as those that exist along the rivers.
 - Research and describe the development of railroads in the watershed. Note that railroads largely followed the course of the rivers and that towns often developed around access to the centers of industry, tourism, and agriculture.
 - Research programs and techniques for protecting valuable historic and cultural entities and apply them to at least one project every two years.

Land Protection/Conservation

future land steward enjoying the floodplain on conserved land in Lee photo by Breakaway Media

Background

The most effective long-term strategy for protecting the rivers is voluntary land protection, either through a conservation easement with landowners or land acquisition by a municipality or conservation group. Voluntary land stewardship practices are helpful, but often vary from one landowner to the next. Regulations such as shoreland protection rules are often minimal and non-durable.

A conservation easement is a legal agreement between a landowner and a conservation organization or agency in the form of a deed that permanently protects the land from development. Conservation easements are granted in perpetuity and apply to the land regardless of who might own it in the future. Land under easement often remains privately owned and managed. Typically, such land is used for agriculture, forestry, wildlife habitat, watershed protection, recreation, and education. The landowner often may continue use of the land as long as terms of the easement are not violated. The land trust or municipality that holds the easement is obligated to monitor it annually and enforce its terms if necessary.

The land that affords protection to a river is often found along the river, but not always. Land that protects small headwater streams and wetlands is also important to the overall condition of a river. Funding for land protection comes from many sources: town conservation commissions, state grants, federal programs, offsets paid by developers, and private donations of land or money.

Criteria for prioritizing lands for conservation easements are considered through a 3-tiered approach:

first priority:

- land with at least 1,000 feet frontage along the main-stem Lamprey River or tributaries
- parcels with significant acreage _____ acres
- properties ranked highly with a local, regional or statewide conservation plan such as
 - NH Coastal Watershed
 - NH Wildlife Action Plan
 - town master plan
 - other _____
- parcel adjacent to other conservation properties (combined acreage _____)
- parcel contained within a large, unfragmented block of undeveloped land (acreage of block _____)
- land with significant
 - scenic value
 - wildlife habitat
 - natural communities or rare, threatened, or endangered species
 - cultural, archaeological, or historical features
 - recreational access to the river
- properties currently being used as productive open space, e.g. farming, forestry, etc.
- land with potential negative impacts on the river (*due to current activities or proposed activities*)

second priority:

- land with at least 500 feet of frontage along the main-stem or major tributary
- parcel in close proximity to a continuous block of protected land that has the potential to contribute to large unfragmented blocks of undeveloped land
- parcels without outstanding conservation attributes that are adjacent to other protected property
- river projects that would enhance the adjacent property's conservation attributes
- land with moderate scenic value, wildlife habitat, natural communities and/or cultural, archaeological, or historical features
- properties offering recreational opportunities

third priority:

- land with less than 500 feet of frontage along the main-stem of the Lamprey or a tributary

- parcels within a quarter mile of the main-stem of the Lamprey River or a major tributary
- parcels deemed to have some degree of protection though not necessarily a conservation easement (*steep slope, wetland*)
- land without outstanding scenic value, wildlife habitat, natural communities and/or cultural, archaeological, or historic features
- properties without recreational opportunities

In addition to outright purchase or fee simple purchase of easement, helping landowners understand the ecological value of their land and encouraging best management practices for conserving it are a priority. Recognition of the positive efforts of landowners should be a part of any land conservation program.

The Wild and Scenic portion of the main-stem Lamprey River flows from West Epping to the confluence with the Piscassic River in Newmarket. The quarter mile corridor of this section receives land protection funding from the National Park Service. The Committee's land protection policy is to match or leverage these funds with those of other conservation groups to further the collective conservation goals of communities, landowners, and environmental protection partners. Thus far, LRAC's funding has been expended under the conditions of the 1995 Lamprey River Management Plan (referenced in the federal designation of part of the Lamprey into the National Park Service Wild and Scenic Rivers Program). The funding is intended for the purchase of lands or conservation easements that protect or enhance the assets for which the river was designated (ecology, archaeology, and fisheries protection).

The National Park Service cannot own or manage land within the Wild and Scenic portion of the Lamprey and does not support condemnation of land along the river. It considers providing funding subject to the following conditions:

- *The acquisition is from willing sellers only.*
- *Local municipal authorities approve the acquisition.*
- *The National Park Service cannot own conservation property, so an appropriate local, state, or nonprofit entity must hold the title and management responsibility for any purchased land or easements.*

Funding for land protection in the Wild and Scenic portion may also be received from other sources, but the provisions stated above still apply.

Accomplishments

- As of December 2012, LRAC had leveraged funding totaling \$9,547,210 to protect 2,771 acres at a ratio of 7:3, or more than doubling its National Park Service funding by partnering with landowner donations of land value and matching funds from towns and conservation organizations.

- Presented stewardship workshops and provided notebooks detailing land conservation practices in partnership with the Strafford Regional Planning Commission.

Goals

- Protect lands that support the ecological health and recreational potential of the Lamprey and its surrounding landscape.
- Continue to work with landowners and municipalities to foster interest in permanent conservation of lands associated with the rivers.

Key Future Actions

- Identify properties that are high priorities for permanent protection. Inform individual owners about their land's special features that make them priorities for permanent protection. Inform them of conservation options.
- Continue to support research on the resources of the Lamprey rivers and their corridors to identify key lands to protect. This includes inventories of rare wildlife and plants, important agricultural soils, sensitive or otherwise important habitats, and recreation and cultural assets.
- Seek out funding opportunities and partnerships that support permanent land protection efforts in the landscape of all the Lamprey rivers.
- Create programs that foster stewardship of private lands by landowners and seek ways to reward those who are good stewards.

Outreach and Education

What can dragonflies teach us about the river? photo by RC Grimsley

Background

For over 20 years, the Committee “that speaks for the Lamprey rivers” has created brochures, press releases, videos, public displays, an internet presence, educational curricula, and guides for teachers. Committee members have given testimony and presented programs to the public to support legislation that protects the rivers.

Education and outreach activities are viewed by the committee as vital underpinnings of resource conservation. The Committee’s efforts seek to engage the public to appreciate and protect the outstanding resources of the rivers: clean, abundant water, wildlife, scenic beauty, historic and archaeological features, and recreation. These resources depend on an informed and appreciative public. Enjoyment of the rivers in a manner that preserves the resources must be a part of the Committee’s efforts.

The segment of the main-stem Lamprey River from West Epping to Newmarket is designated as a federal Wild and Scenic River and receives funding through the National Park Service. Some residents of upstream communities have indicated an interest in achieving Wild and Scenic River status for their sections of the river. Educating the public about the rivers and the benefits of the Wild and Scenic Rivers Program will be essential in helping them achieve that goal.

Accomplishments

- Created, updated, and continue to maintain the LRAC website: www.lampreyriver.org.
- Produced seven professional quality videos and made them available to local libraries and town cable channels, the LRAC website, and You Tube.
- Developed and updated The Lamprey River Curriculum for elementary, middle and high school students.
- Commissioned The Story of Peter Little Bear, A Lamprey River Adventure, a story that describes life along the Lamprey in the late 1600s through the eyes of a native boy. It can be used to supplement the curriculum or as a stand-alone book.
- Partnered with regional planning commissions, land trusts and other organizations to provide documents and workshops promoting stewardship, land protection, sport fishing, and public enjoyment.
- Developed portable displays, brought them to local events, and used them as a platform for informing participants about LRAC and the resources of the rivers.
- Created a Small Grant Program that provides seed money for projects that enhance LRAC education and outreach objectives.
- Hired a specialist to assist with education and outreach efforts.

Goal

Cultivate appreciation of and stewardship for the Lamprey rivers and the surrounding landscape by engaging people of all ages through a variety of educational media and experiences.

Key future actions

- Expand, whenever appropriate, outreach and education efforts funded by the Wild and Scenic Rivers Program to all Lamprey River towns.
 - Continue to inform the public, town governments, and state and federal partners about LRAC goals and achievements through written annual reports.
 - Distribute quarterly newsletters to all towns. Include town halls, libraries, and schools.
 - Update all brochures to include the entire river and the tributaries.
 - Continue to promote the Wild and Scenic Rivers Program for the up-stream towns.
 - Continue to fund and guide the position of outreach and education specialist.
- Offer information and programs to a wider audience.
 - Publish wildlife articles in media with wide public appeal.

- Add at least one outreach component per year in conjunction with the working groups that are engaged in land protection, recreation, history and archaeology, and water resources.
- Offer guided support for The Lamprey River Curriculum to be used by at least two schools each year and provide support to teachers to continue to offer it in subsequent years.
- Enlist the help of others to inform the public about the rivers and the committee's work.
 - Continue to develop close partnerships with regional planning commissions, land trusts, and conservation organizations by inviting members to speak to the committee on specific subjects and investigating projects that could be co-sponsored, e.g., public tours of conserved land, film festivals.
 - Continue to support Small Grant projects through Wild and Scenic Rivers funding that support informational and educational objectives.
 - Continue to inform the public about invasive, non-native species that threaten wildlife and habitats, particularly Japanese knotweed.
 - Create a "continuing education" program for Committee members and consider refining and extending it to the public.

Project Review and Comment

reviewing plans, photo by S. Petersen

Background

According to NH RSA 483, local river advisory committees shall have the opportunity and responsibility to consider and comment on any federal, state, or local governmental plans to approve, license, fund, or construct facilities that would alter the resources and characteristics for which the river or segment is designated in the NH Rivers Management and Protection Program. This jurisdiction covers the quarter mile corridor on both sides of a designated river. The designated rivers in this case are the Lamprey, North Branch, Pawtuckaway, North, Little, and Piscassic rivers. Similarly, the Wild and Scenic Sub-committee is advisory to the National Park Service relative to the federal Wild and Scenic River designation, with a goal of protecting and enhancing the lower river (covers the main-stem Lamprey River from West Epping to the confluence of the Piscassic River in Newmarket) where federal permits or projects are concerned. The Committee is “the local voice of the river” in these processes, with state and federal legislative charters to back that voice and ensure that it is heard. Comments generated by LRAC are advisory and must be considered, but LRAC does not have the authority to grant or deny permits.

In addition to review of proposed projects, NH RSA 483 also directs the Committee to advise the NHDES commissioner on matters that pertain to the management of the designated rivers. In this capacity, the Committee makes advisory comments to NHDES and others concerning proposed changes to legislation (e.g., land protection funding by towns and town conservation

commissions, shoreland protection, and change-of-use tax revenue) or issues of concern that might impact the rivers.

In order to perform this important advisory duty, the project review sub-committee is comprised of members who represent several different towns and have a variety of backgrounds and skills. They look at local and state regulations and best management practices that pertain to riverside buffers, stormwater management, construction practices, and post-construction maintenance plans. Special attention is given to the presence of rare or threatened wildlife species or habitats, steep slopes, public access, public water supply areas, changes to infiltration into the soil, and cultural/historic features.

Accomplishments

The Committee began reviewing and commenting on projects in 1990 when Durham and Lee were first nominated into the NH Rivers Management and Protection Program. Later, Newmarket and Epping projects were added through the Wild and Scenic Rivers Program. In 2011, the rest of the main-stem Lamprey River and five tributaries (North Branch, Pawtuckaway, North, Little, and Piscassic) were added. The following are some of the projects that the committee has reviewed:

- a major golf course proposed for 2.5 miles of riverfront in Durham. (Comments focused on protection of a riparian buffer, minimizing wetland and floodplain degradation, and water quality monitoring. Proposal was withdrawn.)
- a potential hydroelectric facility in Newmarket. (Proposal was withdrawn.)
- improvements to Packer's Falls Bridge. (Wild and Scenic LRAC contributed \$15,000 towards the bridge reconstruction which replaced massive concrete railings with metal railings that allow views of the river and increase safety.)
- Wiswall Dam fish passage
- improvements to the Newmarket boat launch
- the Lamprey River water transmission main line. (Resulted in a Clean Water Act, Section 401 permit to allow the Town of Durham increased municipal water usage while protecting Lamprey River habitat and flows.)
- a system for monitoring and controlling power boat speeds on the lower Lamprey River
- reconstruction of Route 87 bridge in Epping. (Comments resulted in NH DOT's hiring a soil bioengineering firm to design state-of-the-art stream bank stabilization, a wildlife underpass, and access improvements. The site was also put under a floodplain conservation easement.)
- commercial development at routes 101 and 125 in Epping
- Durham's proposed shoreland and wetland ordinances

- a large Epping subdivision. (LRAC and NPS brought local, state and federal reviewers together to re-design the project in an “open space” design. Led to adoption of Epping’s Open Space Subdivision ordinance.)
- expansion of parking lot at the Walmart Distribution Center in Raymond
- replacement of a bridge over the North River in Nottingham
- conversion of a small riverfront business to a complex of businesses and condominiums in Newmarket
- revisions to the New Hampshire Shoreland Water Quality Protection Act
- various house lot projects along the river

Goal

Ensure that river protection goals are adequately considered during project design and review at local, state, and federal levels.

Key Future Actions

- Review and comment on all local, state, and federal permits and projects within LRAC’s jurisdiction that have the potential to affect the quality and quantity of water, stream flow, ecology, and other river resources.
- Continue to improve the communications process among the towns, state, federal agencies, and LRAC to provide for timely notification of permit applications for local projects.
 - Send annual reminders to town managers and zoning boards that permits for the quarter mile corridor are required to be reviewed by LRAC.
 - Track how comments were used by applicants, towns, and NHDES.
- Participate when possible in project design meetings, studies, and similar preliminary processes that could lead to actions, projects, or permits related to the river and its resources.
- Provide comments on proposed legislation affecting the river.

LRAC Project Review Sub-committee Process Worksheet

project name _____

Recreation and Public Enjoyment

Having a dog-gone good time on the river. photo by Breakaway Media

Background

People have a natural affinity for water: they seek to be near it and enjoy activities associated with it. These activities include walking, bird-watching, picnics, photography, fishing, boating, and swimming. When people have the ability to enjoy the natural and cultural assets of the rivers and their corridors, they form a connection to the rivers and are inspired to protect them. Long-term enjoyment of the rivers is dependent on being able to access the rivers and enjoy them appropriately through low-impact activities. The recreational resources along the rivers were recognized by the State of New Hampshire in designating the rivers into its river protection program. The National Park Service and the US Congress recognized the recreational resources in designating the lower Lamprey into the Wild and Scenic Rivers Program.

Accomplishments

- Created a popular Lamprey River Tour Map and Guide for river-based recreational opportunities in the Wild and Scenic River towns of Epping, Lee, Durham, and Newmarket.
- Partnered with the Durham Historical Association to offer a tour of the Doe Farm conservation area, showcasing its historic and ecological values.
- Worked with Durham to develop the park at historic Wiswall Dam in Durham. Headed the Wiswall Historic Interpretative Committee to create

three panels of a four-panel exhibit. Developed a plan for a parking lot, canoe launch, and a fenced picnic area.

- Provided a Small Grant to Deerfield to develop the Deerfield Community Trail network and map.
- Purchased land in Lee, gave it to the town, and constructed a launch for non-motorized boats on Highway 152 near Wadleigh Falls.
- Partnered with the Town of Epping to present a “Family Fun Day” at Mary Blair Park. Awarded two Small Grants to the Epping Recreation Department and the Epping Historical Committee to plan trails and other activity areas in the park.

Goal

Improve and increase appropriate, non-motorized opportunities for public enjoyment along and in the Lamprey River and its designated tributaries (North Branch, Pawtuckaway, North, Little, and Piscassic rivers).

Key Future Actions

- Expand and enhance the plan for recreation and public enjoyment activities that includes the entire Lamprey River and its five designated tributaries. Seek planning and financial assistance from the National Park Service and other similar organizations. Utilize their expertise to expand recreational opportunities for people with handicaps.
- Enhance or create additional recreational tour maps to include the towns in the middle and upper Lamprey River and the tributaries:
 - Make use of the proposed Robert Frost Scenic Byway trail developed by the Southern New Hampshire Planning Commission.
 - Gather information from town recreation departments, historical committees, local fishing and boating groups, landowners, and holders of conservation easements to document access points, historical and cultural sites, and/or scenic vistas in each town. List appropriate activities for each site. Label all sites as handicap accessible or not.
 - Seek funding and planning support from the National Park Service and other similar organizations to support additional Lamprey River tour map(s).
- Work with partners (including town recreation, conservation, and historical committees) to support at least one major event per year with some river-based activities at riverside parks in a different town each year. Examples of activities include:
 - road races that have obstacles that mimic conditions in the river such as dams, downed trees, trash, habitat for animals, endangered plants and animals, etc.
 - “Bike It, Hike It, Like It” combination activities for specific audiences such as bicyclists, family groups, etc.

- Mary Blair Family Fun Day
- Raymond Regatta
- walks that introduce the public to the natural resource features of conserved properties or town forests (e.g., Doe Farm)
- winter fun days
- Work with towns to develop appropriate recreational areas:
 - Durham: Complete plans for the Wiswall Dam Park to include designing the fourth panel for the kiosk, addressing parking issues, building a canoe launch, and creating a handicap accessible picnic area.
 - Epping: Follow through on the Mary Blair Park plan to construct trails and a natural playground.
 - Raymond: Investigate the plausibility of refurbishing and reopening the beach area at the Lamprey River Elementary School.
- Advocate for appropriate non-damaging use of river recreational resources.
 - Report erosion issues to towns and potential funding agencies.
 - Inform the public about how to reduce recreational erosion on maps and kiosks.
- Encourage riverside landowners to allow for public access along the river:
 - Study the feasibility and consequences of micro-easements that could encompass stand-alone or pooled properties.
 - Provide information on HB1551 that amended RSA 212:34 that limits landowner liability when the public uses private property.
 - Study the feasibility, legal ramifications, and consequences of public access if the landowner is compensated by the town through reduced taxes or other incentives to allow public access.

Wildlife and Ecology

Blanding's turtle photo by Jon Bromley

Background

The Lamprey River and its tributaries drain a land area, or watershed, of 212 square miles. This is the largest watershed of the Great Bay Estuary, a National Estuarine Research Reserve. Despite an increasing human population, this largely forested and relatively undeveloped area supports important floodplain forests, extensive shrub and emergent marsh wetlands, and scattered openings and fields among the forested uplands. The floodplains, backwaters, vernal pools, fields, and forests are home to a great diversity of wildlife including significant populations of Blanding's, spotted, and wood turtles, species of conservation concern in New Hampshire.

The Lamprey is one of the state's most significant rivers for anadromous fish (fish that migrate between fresh and salt water) such as river herring and American shad, as well as many strictly freshwater fish. More than 150 species of birds use the river corridors to breed, over-winter, or stop over during migration. Protection of natural habitat ensures ecosystem services such as low or no-cost maintenance of clean groundwater, river water, healthy soils, and flood protection. In addition, the Lamprey supports the ecosystem and ecosystem services of the Great Bay Estuary by providing fresh water and habitat for the many species found there.

Compared to other rivers in the region, the Lamprey River's channel, floodplain, and adjacent wetlands are still relatively intact, making possible the wide variety of plants, fish, and other wildlife that live here. Their persistence depends on maintaining clean water, natural flow patterns, riverside vegetation, and uplands that are not fragmented by haphazard development. Undeveloped riverside areas (buffers) and associated wetlands help protect the river from soil erosion

and sediments, excessive nutrients, pollutants, and over-heating in summer sun, as well as slowing the flow of seasonal or storm flood waters.

The ecology of the Lamprey, as summarized above, was found by the National Park Service to represent an “outstandingly remarkable” resource worthy of recognition and protection through the Wild and Scenic Rivers Program (1995 Draft Report to Congress). In 2011, NH Rivers Management and Protection Program designated the entire Lamprey River and its five major tributaries into the state's program, citing many of the same values. The ecological integrity of the river corridor is being challenged by several issues: the human population increased 15% from 1990 to 2000 and more than tripled from 1960 to 2000 (<http://100yearfloods.org>); the landscape is rapidly being developed resulting in fragmented and lost habitat; invasive, non-native species are becoming more common; fish passage is obstructed by dams and numerous culverts; demand for public water is high; and stormwater runoff is carrying sediments and nutrients into the rivers.

Accomplishments

- Sponsored research on turtles, mussels, birds, plant and plant communities, floodplains, and dragonflies along the main-stem Lamprey River. Co-sponsored research on fish that rely on the main-stem and the tributaries. This body of research has been used to guide land protection and in-stream flow management priorities.
- Worked with NH Fish and Game and the US Fish and Wildlife Service to advocate for fish passage at the Wiswall Dam in Durham. In 2011, a fish ladder was installed and more than 30,000 river herring were able to travel past the dam and access breeding areas that had been unavailable to them for 200 or more years.
- Worked with the Outreach Sub-committee to sponsor a Small Grant to research other opportunities at dams that might lead to improved fish passage along the lower Lamprey River.
- Worked with partners to test methods for managing invasive Japanese knotweed.
- Worked with the Outreach Sub-committee to fund a Small Grant that led to the creation of a lending library of tools to eradicate invasive plants in the Great Bay Estuary drainage area. As of 2013, the tools have been used on 65 restoration projects. The library is housed at the Great Bay Discovery Center.
- Worked with high school students to study vernal pools and produced Spring into Vernal Pools DVD to educate the public about these special ecological habitats.

Goals

- Work with towns and landowners to expand existing wildlife habitat inventories and conservation plans for the Lamprey River watershed area.

- Protect and restore the ecological functions and resources of the Lamprey River that are critical to wildlife and humans.

Key Future Actions

- Encourage sustained ecological integrity in the watershed.
 - Pick a few key indicator species to monitor over time.
 - Seek out and conserve land that promotes corridors for wildlife.
 - Increase the degree of connectedness for wildlife passage within the watershed.
 - Review the NH Wildlife Action Plan and the NH Climate Action Plan for ideas and guidance.
 - Work with partners to conduct programs that inform riparian landowners about wildlife needs on their property.
 - Promote wide riverside buffers as important to wildlife and water quality. Work with towns to enact buffer protection regulations.
 - Help people to understand their connection to nature and wildlife: how to maintain wildlife habitat, how to safeguard soil and clean water.
 - Protect headwater streams and beaver dams.
 - Map stormwater outfalls to prioritize retrofit projects to ensure that the worst offending systems are dealt with first. A good place to begin mapping outfalls would be in towns that have seen a significant increase in impervious surfaces.
 - Survey stream crossings to prioritize stream crossing replacement projects.
- Provide outreach that encourages the public to appreciate the importance of wildlife and ecology to clean, abundant water, public enjoyment, education, and land protection:
 - Continue to make wildlife and ecological considerations a priority in land protection efforts.
 - Identify key audiences and work with the outreach program to develop targeted materials.
 - Continue to grow the vernal pool program.
 - Continue to arrange opportunities for family dragonfly hunts.
 - Increase awareness of wildlife in their habitats.
 - Address road salt and encourage towns to reduce it; study possible effects of extra road sand (from less salting) on wildlife.
 - Tap into local knowledge: landowners, recreationists, conservation commissions, etc..
- Prioritize projects; find funding for research and restoration projects.

Glossary

class B waters – Of the second highest quality, these waters are considered acceptable for fishing, swimming, and other recreational purposes, and, after adequate treatment, for use as water supplies. NHDES has numeric and narrative criteria for these uses. Antidegradation provisions also apply (See [NH RSA 485-A:8](#)).

conservation easement – A legal agreement between a landowner and a conservation organization or agency in the form of a deed that permanently protects the land from development.

habitat fragmentation – The division of habitat into smaller and less productive pieces, usually by the construction of roads or other barriers to certain wildlife.

habitat loss – The destruction of natural areas through clearing of vegetation, filling in of wetlands, creation of impervious surfaces, flooding of uplands from dams, and extreme pollution.

impervious surface – Hard-covered surfaces such as pavement and roofs that do not allow water to soak into the soil. Compared to natural surfaces, water runs off more quickly and is usually dirtier. Many studies indicate that no more than 10% of a watershed should consist of impervious surface. (See Center for Watershed Protection, 2003.)

invasive species – Non-native plants or animals that are particularly aggressive in out-competing native species, thereby degrading habitat for resident species.

pervious surface – Land surfaces that allow precipitation to infiltrate into the soil, e.g., forests, fields, lawns, unpaved driveways, etc. Certain pavement and concrete can be made to be pervious so that water infiltrates rather than running across the surface.

riparian – Relating to or located on or near the banks of a natural watercourse.

runoff – The portion of precipitation that does not infiltrate the soil but runs directly off the land into surface waters. Often contains eroded soil or pollutants picked up from paved or other impervious surfaces.

stormwater – Precipitation that does not infiltrate the soil, usually used in reference to runoff in developed areas.

watershed – The geographic area that drains water into a river, lake, or estuary directly or from tributaries or groundwater. The study of a watershed should include wildlife and human populations, the amount and kind of land development, and the ability of water to flow and of fish to migrate naturally.
